

Chat Translator guide

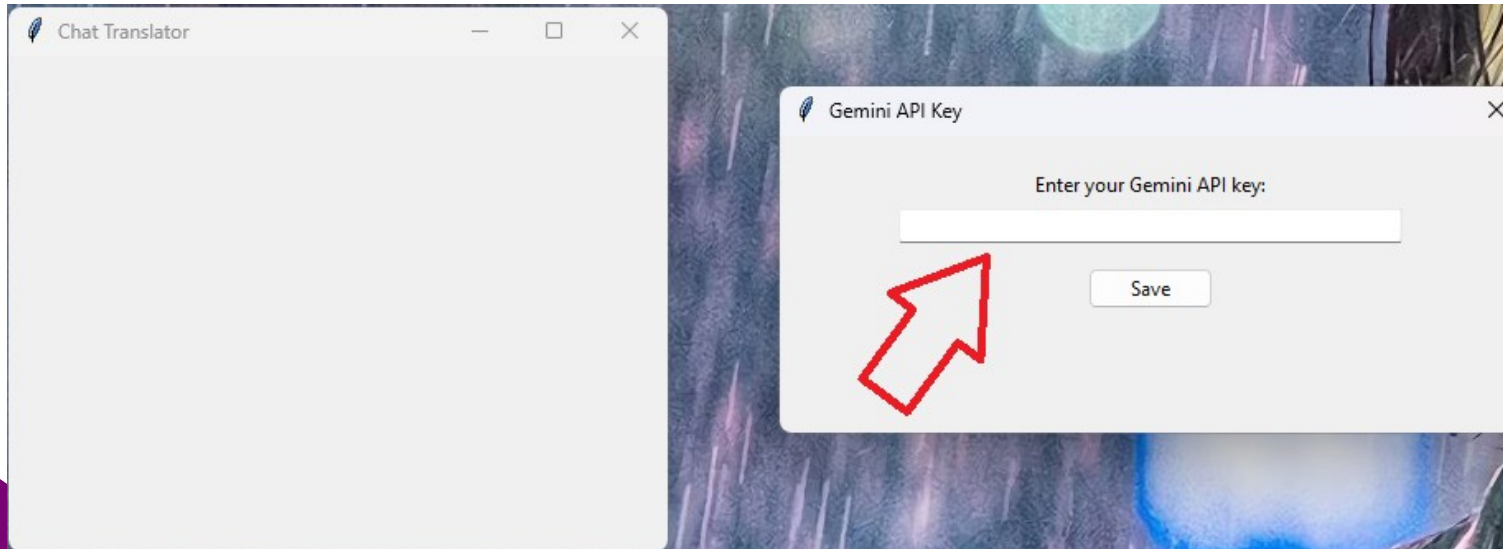

Step 0: Creating an API Key

- 1) Go to aistudio.google.com
- 2) Log in with your google account
- 3) Click on 'Dashboard' > 'API Keys' > 'Create API Key'
- 4) Name and Project do not matter, name it, or don't
- 5) Once the API Key is created, copy it to your clipboard

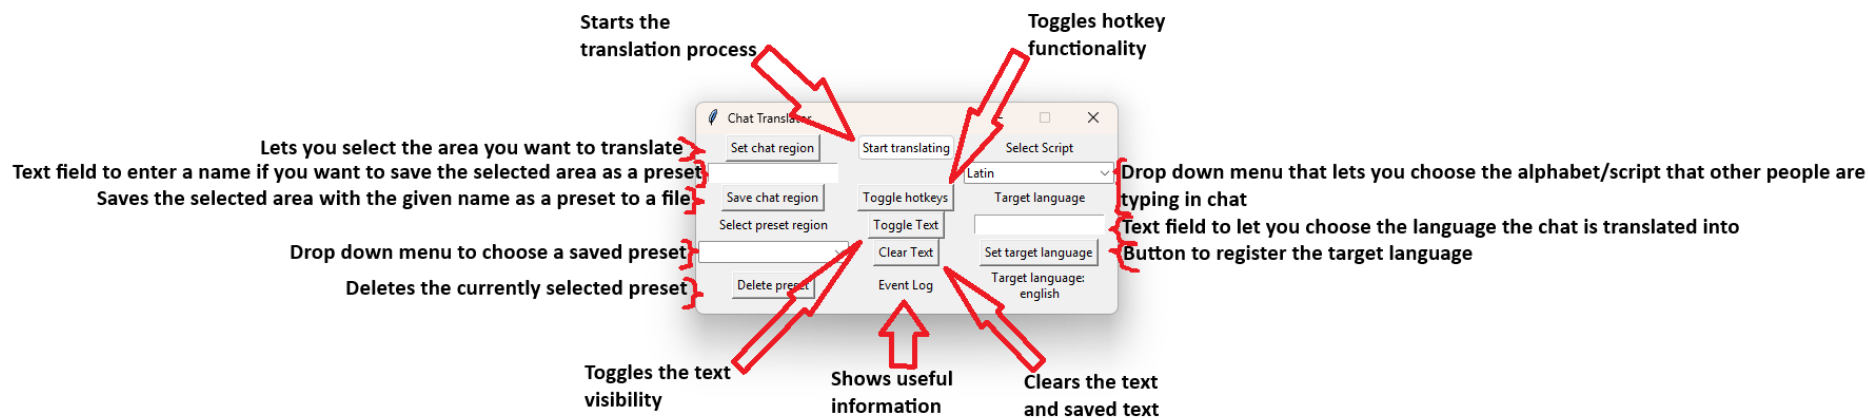

Step 0.5: Starting the .exe

- 1) Download the exe. If your antivirus quarantines it, delete the exe and download the exe into a folder not scanned by the anti virus.
- 2) Start the program. Be prepared to wait up to a minute, it takes time to start.
- 3) A window should open asking you to paste your API Key. Paste the API Key that you just made. You should only have to do this one time.

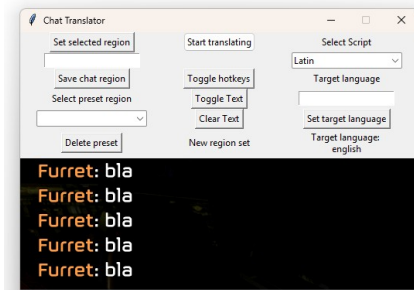

UI overview

Step 1: Choose a chat area

- Click on 'Set chat region'.
- This is where you choose what part of the screen is the chat that should be translated.
- I recommend choosing an area where the text is whole and not cut off, and that doesn't include the text box where you are writing your own messages. Example: →
- The 'Set chat region' button is on a 3 second timer, so if you have only 1 monitor you should be able to go back into the game in time
- You might have to set a display setting in game to 'Borderless Windowed', as 'Windowed' might not let you take the screenshot in the game.
- After setting the area, there should be a preview of what the program is seeing in the window.

Step 2: Choose an alphabet / a script

The text detection program works best if it knows what language to expect. This is a short guide on the different scripts:

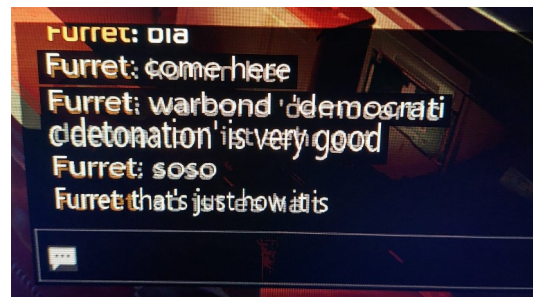

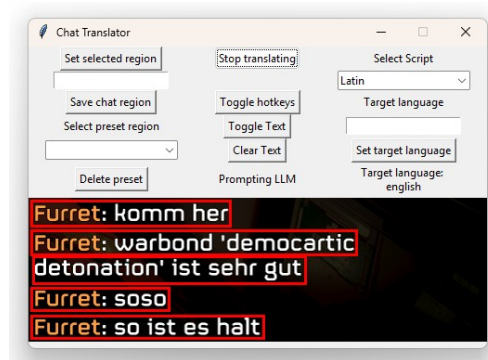

- Latin: The morning sun shines brightly over the quiet hills. | The alphabet that English uses
- Simplified Chinese: 清晨的阳光照亮了宁静的山丘。
- Traditional Chinese: 清晨的陽光照亮了寧靜的山丘。 | Some letters are more complicated than Sim. Chi.
- Japanese: 朝の太陽が静かな丘を明るく照らしています。
- Korean: 아침 햇살이 고요한 언덕을 밝게 비춥니다 .
- Cyrillic: Ранкове сонце яскраво світить над тихими пагорбами. | Used by many eastern European countries
- Arabic: تشرق شمس لصباح فوق الغلال الهادئة. | Used in the middle east and north Africa
- Devanagari: सुहृद सूर्यशतपुङ्खिकः अरुचकस्तु है | Used in northern and west India
- Thai: แสงแดดยามเช้าส่องสว่างเหนือเนินเขาอันเขียวสงบ

Step 3: Choose a target language

- Here you choose what language the chat should be translated into.
- You can write the language in your own language or in English, so
‘Spanish’ or ‘español’
‘Chinese or 中文’
‘Ukrainian or ‘Українська’
all work.
- You *can* input garbage, but it won’t do anything.
- The last language you set is saved across sessions.

Step 4: Start Translating

- Hitting 'Start translating' should automatically do the following things:
 - 1) Detect and show the text in the preview in the UI
 - 2) Pause at the 'Prompting LLM' step
 - 3) Overlay the received text over the chat
 - 4) Once it detects new text it will reprocess the text and quickly display a new translation
- Unfortunately the translation cannot be captured by a screenshot or by screen capture software. Maybe I will change this in the future.
- Clicking 'Stop translating' will pause the translation.
- The version of the program will likely come with a terminal window. If there is an error message and the translation has stopped, try restarting the translation by stopping and starting it again.

Other features

- Entering a name into the left text box lets you save an area with a name, so that you don't always have to re-select the chat area. This preset can then be found in the preset drop down menu.
- 'Toggle text' hides and displays the text
- 'Clear text' clears the text from the screen and from memory, forcing a re-translation
- 'Toggle hotkeys' turns on the hotkey functionality which basically turns off the translation when the in game text chat is closed. Might require pressing 'Toggle text' to sync the state. Currently fine tuned for **Helldivers 2 specifically**, probably doesn't work with other games.
